

1 Template Management

Overview

HYDRA menu	Order management → Template management → Template management
FEDRA menu	Detailed Scheduling → Master data → Template management
Transaction code	edtpl
Function authorization	edtpl

Purpose

A template can be regarded as a default to populate operation fields for which no data is entered or transmitted from the ERP system.

Integration

Depending on the action involved, the system determines the values from the template and assigns these values to the operation. These actions can be:

- manual creation of new operations
- transfer of operations from the ERP system
- change of operation if the workplace group has changed

Production resources and tools, components or long texts cannot be defined as templates.

A template number can only include *one active* template .

Selection criteria

The application provides the following selection criteria:

Order type

Order type for which the template is valid.

Group

Workplace group for which the template is valid.

Workplace

Workplace for which the template is valid.

Type

Template type

AU = Order Header

AG = Operation

Order

Order used as the basis for generating an order when templates are used.

Active

Specifies if the template is active.

Field descriptions**Template**

Template number

Active

Specifies if the template is active.

Type

Template type

AU = Order Header

AG = Operation

Version

Template version

Order type

Order type for which the template is used.

Order

Order or operation defined for the template.

If you create a template for the type "order header", enter a number that corresponds to the configured order number length. Recommendation: If possible, use the template number as order number.

If you create a template for the "operation" type, the allowed number length depends on the configuration in the basic settings. The length of the number must not exceed the order number length + sequence number length + operation number length if the split number length is > 0.

Group

Workplace group for which the template is used.

Workplace

Workplace for which the template is used.

Comment

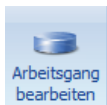

Template comment.

Toolbar

Edit order (function authorization edtpl.order)

Use the function to edit the order header data for a template:

Edit operation (function authorization edtpl.operation)

Use the function to edit the operation data for a template:

Processing

The system uses the following order to identify a template:

- Order type + machine
- Order type + machine group
- Order type
