

1 Wage Type Determination

Overview

Menu	Master data → Incentive wage → Wage type determination
Transaction code	wtdet
Function authorization	wtdet.*

You use the *Wage type determination* to assign the wage type to the time tickets that are allocated individually for each person. To identify the relevant wage type, you create a set of rules that are processed in a specified sequence. Using these rules, the wage type is identified which then controls the further calculation of the incentive wage.

Example and explanation

Sequence 100: wage type from posting

The combination */* as reference/value means that this first rule uses the wage type of the original posting. With BDE personnel postings, this is the wage type that has been passed from the operation to the personnel posting when the personnel posting has been recorded.

Sequence 110: wage type from operation if wage type is empty

The combination wage type/"" (empty) as reference/value means that this second rule only applies if the time ticket does not yet have a wage type. In this case, the wage type of the operation is passed to the time ticket. If the posting does not include an operation or if the operation does not include a wage type, the wage type of the time ticket remains empty.

Sequence 120: assign wage type 4100 for overhead operations

This rule has the effect that wage type 4100 is assigned to all BDE personnel postings that include an overhead cost operation, regardless the wage type that is currently specified for the time ticket. The category of the BDE order type specifies if it is an overhead cost operation.

The special function authorization "**wtdet_foreman**" has been created for users who must make small changes to the *Wage type determination* in the day-to-day business to integrate specific exceptional situations. It is a **limited function authorization**. Users with this function authorization have less rights than users without this limited function authorization.

Users with the function authorization "wtdet_foreman" can only edit the following rules:

- Conditions for persons, machines, machine groups or premium groups
- Sequences from 500 to 600

With this function authorization, the user can remove single persons or machines from the piecework or the group incentives. The user can view other data records, but not edit them. The system rejects unauthorized editing attempts and issues the error message No. 1923 "Not authorized for this sequence or condition".

If you want to create and edit system configurations for sequences below 500 and above 600, the user must be the system administrator (without the function authorization "wtdet_foreman").

The initial data of the system contain the function authorization "wtdet_foreman" in the function profile "LLE user". Use the function profile "LLE admin" for users who must be fully authorized. The function profile "LLE admin" includes all authorizations of the profile "LLE user".

Optionally, you can also delete the function authorization "wtdet_foreman" from the function profile "LLE user".

Field description

Sequence

The rules are processed according to the specified sequence. If several rules contain the same entry in field *Sequence*, then the sorting is performed using the condition/value 1 to 5, the source of the wage type and the wage type.

Comment

Free comment field

Valid from/until

You can use these two fields to limit the validity period of rules.

Assign wage type

This setting specifies the wage type that is assigned to the time ticket if the rule is applied (according to the specifications made).

The specified wage type: the wage type specified in the field below is assigned.

From posting: the wage type passed with the posting is assigned. The posting itself is based on the time ticket. The wage type is usually the wage type of the BDE personnel posting.

From operation: the wage type stored with the operation is identified and assigned to the time ticket.

From HR master data: the wage type stored in the HR master data is identified and assigned to the time ticket.

If – conditions 1 to 5

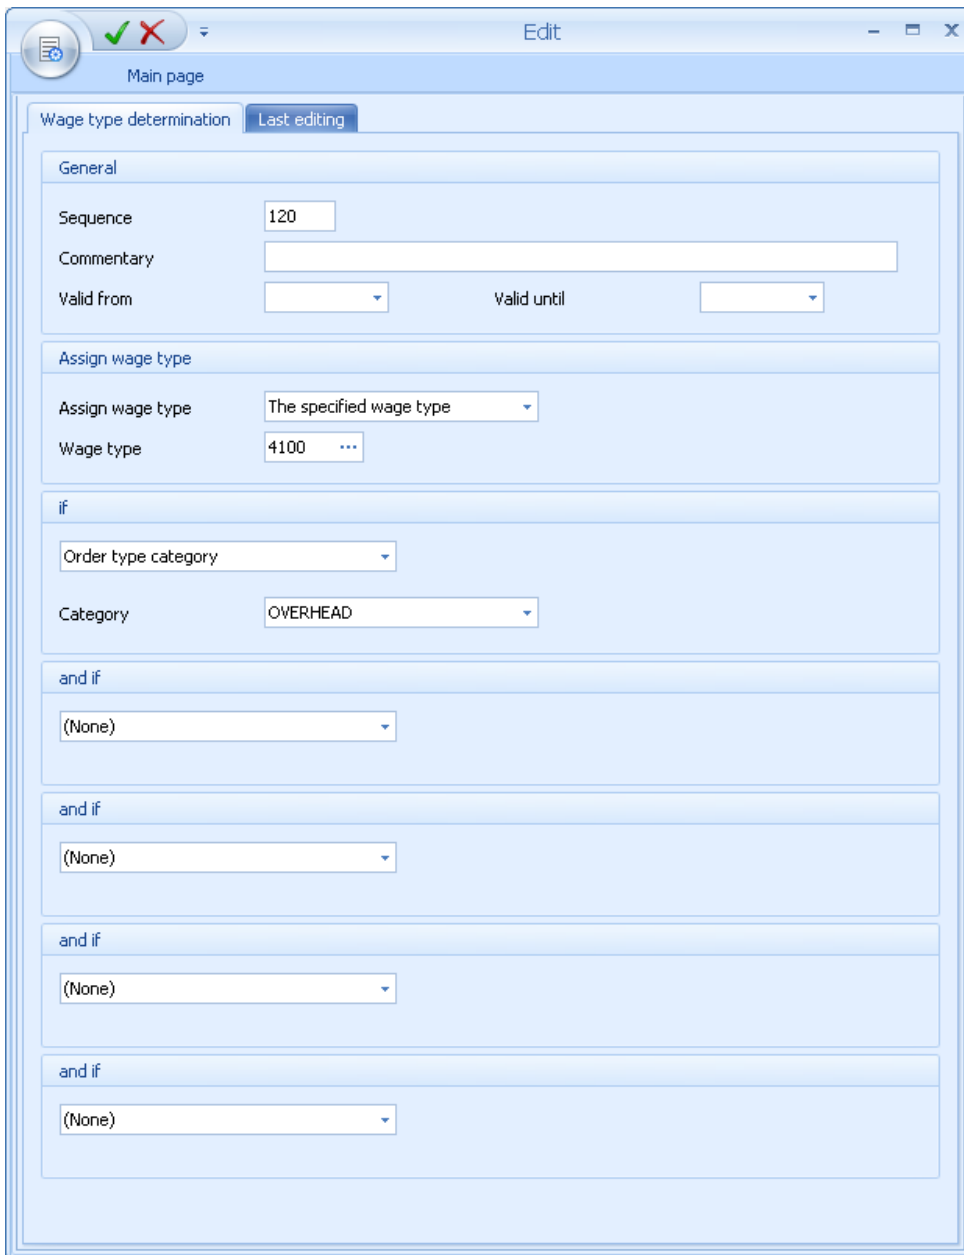

Using up to five conditions, you can control when the rule is applied. All conditions specified must be true. Only then the rule comes into effect. The following conditions with the respective values are available:

Reference	Value	Available with function authorization wt det_foreman
Machine	Machine number	X
Machine group	Machine group	X
Person	Personnel number	X
The person's cost center	Cost center of the person defined in the HR master	
Cost center of the posting	Cost center of the posting	
Premium group	Premium group The value "*" is permitted. This means that the rule always applies, if a premium group is entered in the posting. The value "" (empty) is also permitted. This means that the rule applies, if no premium group is entered in the posting.	X
Premium indicator	Premium indicator defined for the person in the HR master	
Incentive wage indicator	Incentive wage indicator of the machine	
Piecework indicator	Piecework indicator of the operation	
Order type	Order type (e.g. is used to assign overhead cost orders to a different wage type)	
Category order type	Order type category (e.g. is used to assign overhead cost orders to a different wage type)	

Premium group type	Premium group type	
Wage type	Wage type Wage type that has been assigned to the posting up to now (for changes). Empty value is permitted.	
(none)	Always This reference does not restrict the rule, the rule always applies.	

Editing functions

The following dialog opens to edit a data record:

The dialog box is titled "Edit" and contains the following sections:

- Wage type determination** (Active tab)
- Last editing** (Button)
- General**
 - Sequence: 120
 - Commentary:
 - Valid from:
 - Valid until:
- Assign wage type**
 - Assign wage type: The specified wage type
 - Wage type: 4100
- if**
 - Order type category:
 - Category: OVERHEAD
- and if**
 - (None)
- and if**
 - (None)
