

1 Inspect Attributive Characteristics

The main role of the dialog is the evaluation from previously selected characteristic. Evaluation is done using information of the number of nonconforming units (field "No of nonconforming units"). Also the number of inspected parts must be collected (inspected sample size). The sample size to be inspected is displayed for information purposes. The inspection result incl. of optional comments are automatically assigned to "Value no" 1.

If the inspection result could be saved successfully, a message line containing relevant information is sent right after closing the dialog and before the collection catalog is opened again. The message line is located above the characteristics list. If the data is saved the message line is highlighted in green. If it is not saved the color is pink. That is the case if there is no network connection.
