

1 SAP - Remote Function Call

Definition

The Remote Function Call (RFC) is the base technology for a system-wide call of programs on SAP R/3 and/ or ECC or partner systems. RFC will be triggered by the RFC client and be transferred to the partner system's server. The following variants are known:

Synchronous RFC (sRFC): the calling program will wait until the called function module has been processed and the results been transferred.

Asynchronous RFC (aRFC), It will be determined whether the called system is available but it won't be waited until processing is completed.

Transactional RFC (tRFC), the called system will be responsible for the execution of all function modules or - in the event of errors - ensure that no changes will be made. tRFC runs also in asynchronous mode. It is the basis for the IDoc communication.
