

1 Configuration for WIP Material

Usage

In material and production logistics, it is possible that output batches must be processed in the next process step already, even though they are still running in the current production process (predecessor).

However, in order to enable this [processing](#) of so-called WIP material, the appropriate configuration is required.

Configuration

The following configuration has to be provided for the [material type](#) (Master data → Material → Material type → General) of the output batch/input batch used:

WIP material (Work in Process)

The identifier for WIP material processing has to be set. It determines whether a batch of this material type may automatically be logged on as the input batch for the subsequent operation (based on the operation sequence within a production order).
