

1 Configuration: Filter by produced output batches

Purpose

Use this configuration if you want to filter the third list of the AIP 8.2 in the main view. The filter affects the *produced output batches* displayed in the third list. The filter specifies that the *produced output batches* only show those batches pertaining to a currently logged in operation.

Requirements

Service pack 12 must be installed.

Procedure

By default, the file *globaldefines.xml* includes a commented out text block. The commented out text block is:

GLOBALDEFINES.XML

```
...
<!-- <FilterFields>

    <Field ID="1">AST=L</Field>

</FilterFields> -->
...
```

Comment in the text block. You activate the filter if you comment in the text block. Remove the characters <!-- and --> at the beginning and end of the text block in order to comment in the text block. The result must look as follows:

GLOBALDEFINES.XML

```
...
<FilterFields>

    <Field ID="1">AST=L</Field>

</FilterFields>
...
```

Result

The third list in the *Produced output batches* tab of the AIP 8.2 main view is filtered by logged in operations.
