1 Overview of Graphic Order Sequencing

Possible fields of application

The graphic order sequencing (GAV) is an integrated planning module for the preparation of sequencing lists for an organizational unit within the scope of shop floor control. Interactive planning is done by modifying the current planning situation manually.

Implementation notes

The function package can be used if you do not need to take restrictions into account for order/operation sequencing (e.g. checking the capacities of primary or secondary resources, checking of relationships, checking of basic dates) and you do not require planning automatisms (e.g. automatic assignment) for the planning process.

Consequently, order sequencing represents a cost-effective alternative to HYDRA shop floor scheduling (HLS) for the planning of production orders.

Integration

The result of planning orders/operations onto individual machines can be seen in the order sequencing at shop floor terminals: the operations are shown in the planned order as per the sequence planning of the graphic planning board.

Functions

Functions for the following tasks are integrated:

- Displaying operations that are stored in the pool of orders related to a group in HYDRA.
- Presentation of the planning situation in a Gantt diagram.
- Manual planning of an operation onto a workplace/machine.
- Manual replanning of an operation onto another workplace or group
- Specification of a processing sequence ("sequencing") as basis for displaying the operations to be produced in the sequencing list at the terminal
- Splitting of operations (requires the license BDE-SSG.)
