1 Overview – Personalized Evaluations

Purpose

The function package provides overviews and evaluations in MOC on BDE postings for which personalized postings exist.

Integration

The display or evaluation is performed on the basis of the personalized postings at the BDE terminal as part of the function package "Personalized BDE functions" (BDE-BPF) and the resulting posting in the system.

Features

- Personnel shift log with person-related and shift-related listing of the completed orders, incl. graphic representations of quantities and times.
- Personnel overview with display of which employees are currently logged on at which machines / workplaces and cost centers.
- Personnel report with list of which employees of an organizational unit (foreman's area, cost center, department) have processed which operations in selected shifts or periods, incl. statistics with target/ actual comparison of times and quantities.

2 Staff Logged on / Personnel Overview

Overview

Menu	Production control → Production overview → Staff logged on
Transaction code	pnov
Function authorization	pnov

Usage

The personnel overview provides the user in structured form current context related information relevant to personnel in production. The necessary information is displayed from the standpoint of the relevant person.

Integration

The personnel overview is an indispensable instrument for persons with HR responsibilities and for planners. The user has all of the information needed at a glance that will allow her/him to make spontaneous decisions on personnel issues. In day-to-day operations, especially at times when swift, yet sensible decisions need to be made in production, the personnel overview is an extremely helpful tool to those with responsibility.

Shown in the personnel overview are all people who are currently logged onto a workplace and who match the selection criteria entered in the selection panel. If the "waiting period processing" is active, the system also shows those people who are currently logged onto a waiting period operation.

Irrespective of the selections made below, only persons are shown for whom the editor has been authorized for the relevant responsibility area.

The review of the valid responsibility area authorization is performed by checking against the responsibility area for the workplace at which the person is logged on. If the person is logged onto a waiting period operation, then the review is based on the person's responsibility area.

Selection criteria

The application provides the following selection criteria:

Person from ... to ...

This selection criterion refers to the personnel number in the HR master data. All people are shown who are found in the range of the selected personnel number.

Employee group from ... to ...

This selection criterion refers to the employee group in the HR master data. All people are displayed who belong to the selected employee group. You can also run a search using wildcards (placeholders *) in the field.

Last name

This selection criterion relates to the last name in the HR master data. All people are displayed with the selected last name. You can also run a search using wildcards.

Company

This selection criterion refers to the company in the HR master data. All people are displayed who are assigned to the selected company. You can also run a search using wildcards.

Area

This selection criterion relates to the area in the HR master data. All people are displayed who are assigned to the selected area. You can also run a search using wildcards.

Cost center

This selection criterion refers to the cost center in the HR master data. All people are displayed who are assigned to the selected cost center. You can also run a search using wildcards.

Workplace from ... to ...

This selection criterion references the workplace in the machine or workplace master data. Displayed are all people currently logged onto a workplace that matches the specified selection criteria. You can also run a search using wildcards in the field.

Group from ... to ...

This selection criterion references the group in the machine or workplace master data. Displayed are all people currently logged onto a workplace that is assigned to the group that was entered. You can also run a search using wildcards in the field.

Cost center

This selection criterion references the cost center defined in the machine or workplace master data. Displayed are all people currently logged onto a workplace that is assigned to the cost center that was entered. You can also run a search using wildcards.

Order

All people currently logged onto an order/ operation pertaining to the order number entered are displayed. You can also run a search using wildcards.

Order type

All people are displayed who are currently logged onto an order/ operation for the selected order type.

Staff logged on detail application

Person category

Person

Personnel number according the HR master data

Last name

Last name according the HR master data

First name

First name according the HR master data

Name

Entire name (last name, middle name and first name) according the HR master data.

Operator position

Operator position (abbreviation) that the person used to log onto the workplace.

This requires that operator positions are configured for the workplace and that the system expects an operator position to be entered in the posting dialog (depending on how the system was customized/ configured).

Staff badge number

Staff badge number according the HR master data

Company

Company that the person is assigned to according to HR master data.

Area

Area that the person is assigned to according to HR master data.

Department

Department that the person is assigned to according to HR master data.

Cost center

Cost center that the person is assigned to according to HR master data.

Employee group

Employee group that the person is assigned to according to HR master data.

Premium indicator

Premium indicator (abbreviation) that the person used to log onto the workplace.

This requires that wage/ premium indicators are configured for the workplace and that the system expects a premium indicator to be entered in the posting dialog (depending on how the system was customized/ configured).

Logon category**Date**

Point in time (date) since when the person has been logged onto the workplace.

Time

Point in time (time) since when the person has been logged onto the workplace.

Workplace category**Workplace**

Number of the workplace at which the person is logged on.

If the person is logged onto a waiting period operation, shown here is the workplace that the person is assigned to according to the HR master data.

Group

Group that the workplace is assigned to according to the master data.

Cost center

Cost center that the workplace is assigned to according to the master data.

Company

Company that the workplace is assigned to according to the master data.

Order category**Order type**

Order type of the operation at which the person is logged on.

Order

Order number of the operation at which the person is logged on.

Sequence

Sequence number of the operation at which the person is logged on (depending on how the system was customized/ configured).

OP

Operation number of the operation at which the person is logged on.

Split

Split number of the operation, if the operation that the person is logged onto is a split operation (depending on how the system is customized/ configured).

SOP

Sub operation number (reserved)

Operation designation

Operation designation for the operation at which the person is logged on.

Article

Operation number for the operation at which the person is logged on.

Article designation

Article designation for the operation at which the person is logged on.

Toolbar

In general, the parameters for calling the function or target application are taken over from the table. For this reason, an entry should always be selected before calling an application.

Log person off

A person can be logged off from an operation/ workplace using the [log person off](#) function.

Order information

This button opens the application [order information](#).

Order overview

This button opens the application [order overview](#).

3 Personnel Report

Overview

	→	
Menu	Order management → Production reports → Personnel report	
Transaction code	pnrp	
Function authorization	pnrp	

Usage

The purpose of the personnel report is to provide the ability to create a list in which all personal postings are displayed for a selection of people showing a target/ actual comparison that indicates time and quantities over a certain time interval.

Integration

Define a report period applicable for the data to be requested and shown in the report.

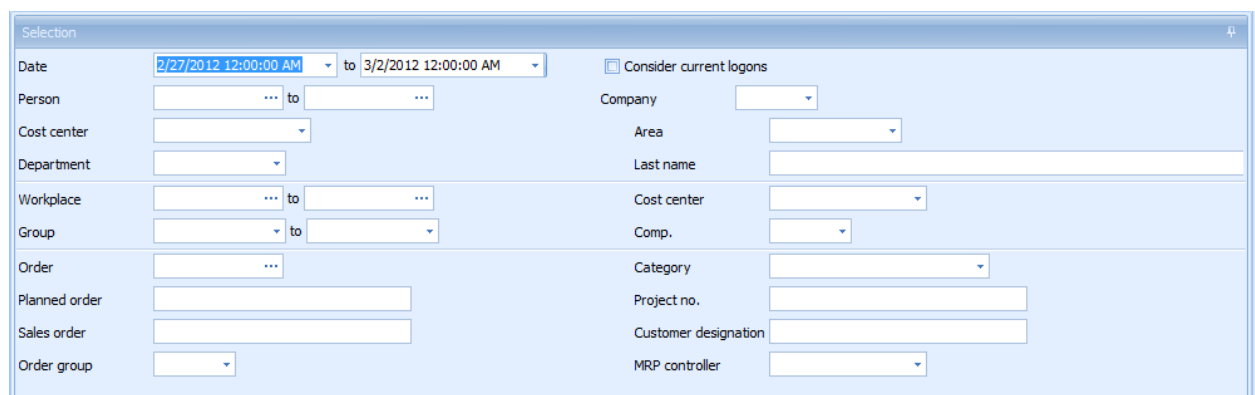

The date area is clearly differentiated from the login date.

For interrupted operations, the login time from the personal postings is used and the current login time is used for running operations.

Requirement

To use the personnel report, what is required is that personnel-related postings were made and that relevant postings are in the system.

Selection criteria

The application provides the following selection criteria:

Date ... to ...

Narrows down the data records based on the date and time.

The report period relates to the person's login time, i.e. all personal log records (record type B) are selected that have a login time that is within the selection period.

Consider current logons

Choose this option to also show persons who were logged on in the period entered and who are currently still logged on.

Person from ... to ...

Personnel number of the persons displayed.

Company

This selection criterion relates to the company defined in the HR master data. All persons are displayed that are assigned to the selected company. Generally, the selection is based on the current HR master data (the HR master data of this version is not supported)

Cost center

The person's cost center as defined in the HR master data. Generally, the selection is based on the current HR master data (the HR master data of this version is not supported)

Area

Area defined for the persons as defined in the HR master data. Generally, the selection is based on the current HR master data (the HR master data of this version is not supported)

Department

Department defined for the persons as defined in the HR master data. Generally, the selection is based on the current HR master data (the HR master data of this version is not supported)

Last name

Selection by the person's last name as defined in the HR master data. Generally, the selection is based on the current HR master data (the HR master data of this version is not supported)

Workplace ... to ...

This selection criterion references the workplace in the machine or workplace master data. The selected workplace is displayed.

Cost center

This selection criterion references the cost center defined in the machine or workplace master data. All machines or workplaces are displayed that are assigned to the selected cost center.

Group ... to ...

This selection criterion references the group in the machine or workplace master data. All machines or workplaces are displayed that are assigned to the selected report group.

Company

This selection criterion references the company defined in the machine or workplace master data. All machines or workplaces are displayed that are assigned to the selected company.

Order

Selection by edited orders.

Category

This is the order type category.

Planned order

A planned order defined at the order.

Project number

A project number defined at the order.

Sales order

Selection by processed sales orders.

Customer designation

Selection by the customer designation defined at the order.

Order group

Selection by the order group defined at the order.

MRP controller

Selection by the MRP controller defined at the order.

Personnel report detail application

The list only includes data of people for whom the user has authorized rights to (authorization via the person's area of responsibility). As concerns merged operations formed at the console, ONLY the individual operations are displayed, not the merged operations themselves.

A table is generated for the requested data and output showing the following information:

Person category**Person**

Personal master data such as name, operator position, premium indicator, employee group or even the person's cost center.

Logon/ Logoff category**Logon/ Logoff**

Point in time when the person logs on or logs off.

Workplace category**Workplace**

Workplace at which the person was logged on, as well as the cost center assigned to him.

Order category**Order**

Order/ operation number assigned to what the person produced.

Primary quantities category**Target quantity/ yield/ scrap/ unit**

Target quantity of the operation and the yield or scrap produced by the person (i.e. logged in). The latter is drawn from personal postings (record type "B").

Additional information about personal quantity postings can be found in the chapter *Entry of quantities* in the document *Introduction to HYDRA BDE and MDE*.

Please note: The target quantities shown are not proportionately calculated target quantities, but in fact the total target quantity to be produced for the operation (cf. Order information, index tab *quantities*).

Duration category**Proportionate staff duration/ setup time/ processing time/ actual setup time/ production/ standstills**

In addition to the (target) setup time and the (target) processing time for the operation, also displayed is the logged in duration for the person, allocated by time of production and by standstill period. If the person is logged on at different orders, what will be shown in the column Prop. labor utilization will be the labor utilization attributed to the order (considering current logons).

Please note: The (target) setup time and the (target) processing time for the operation are not the proportionately calculated durations, but in fact the values shown in the order information.

PivotGrid detail application

The "PivotGrid" detail application makes it possible to report and accumulate the data based on other criteria.

The data delivered shows all people and their cost centers and provides a comparison showing which labor utilization was provided for which cost center. The "Cost center" columns refer to the cost center for the workplace at which the people logged on.

4 Personnel Shift Log

Overview

Menu	Order management → Production reports → Personnel shift log
Transaction code	pspr
Function authorization	pspr

Usage

The personnel shift log is an absolute necessity for anyone in a position of responsibility in production. Here, the shift supervisor, the shift manager and the foreman are each provided a clear overview of all of the important information needed relating to their staff.

The personnel shift log is a function in production management. This function makes it possible to create shift-related reports about the produced orders by person. With the additional graphic presentations showing quantities and durations, the user is given an excellent overview of all data concerning personnel.

This function provides the information about the operations completed during a shift. In addition to the quantities produced, the log also shows the time that was required in each case. This is shown for each person logged on at the operation.

Integration

Shown in the personnel shift log are all operations that were selected in the selection panel. Here, only BDE log records of record type "B" are considered.

When data is requested, if selected from the cost center, the responsibility area of the person is verified and if selected from the workplace or group, the responsibility area of the workplace is verified.

It is possible to correct the entered personnel postings in the [BDE-related postings\archive\mast_ind\Functions\MOC\MOC_OrderBookings.pdf](#) function.

Prerequisite

In order to use the personnel shift log, what is required is that personnel-related postings are performed and that the relevant, finished postings (log records) exist in the system.

Selection criteria

The application provides the following selection criteria:

Date from ... to ...

The time period entered restricts the selection by log records. The log records are selected that have a start date (logon date) within the defined period.

The preset value is "Today minus 7 days" to "Today". The date is calculated based on the Gregorian calendar.

Shift all, 1, 2, 3, 4

Within the entered period, only those log records are selected that are assigned to the shift entered according to the shift model.

Operations that are logged in during the currently running shift at the time the data are selected are not considered, because no log records have been generated for them yet.

Workplace from ... to ...

Selects the log records posted to the *workplace* that was entered, the responsibility area of which the user has authorized rights to. You can also run a search using wildcards in the field.

Group from ... to ...

Selects the log records posted to the *workplaces*, the responsibility area of which the user has authorized rights to, and that are assigned to the entered group. You can also run a search using wildcards in the field.

Cost center

Selects the log records posted to the *staff*, the responsibility area of which the user has authorized rights to and that are assigned to the entered cost center.

Personnel shift log detail application

The following fields are displayed in the table:

Shift category**Shift date**

Shift date of the shift in which the operation is completed.

Shift

Shift in which the operation is completed.

Person category**Person**

Personnel number of the person logged on at the operation.

Last name

Last name of the person logged on at the operation.

First name

First name of the person logged on at the operation.

Name

Entire name of the person (last name, middle name and first name) who was logged on at the operation.

Operator position, designation, description

Operator position that was used when the person logged onto the workplace (depending on how the system is configured).

Order category**Category**

Order category for the order/ operation, e.g. production order (FA) or overhead cost order (GK).

Order type

Order type of the order

Order

Order number of the order/ operation.

Sequence

Sequence number for the operation (depending on how the system is customized/ configured).

Operation

Operation number for the operation

Split

Split number of the operation, if the operation is a split operation (depending on how the system is customized/ configured).

Article/ article designation

Article number and article designation of the operation.

Workplace category**Workplace/ group/ cost center**

The workplace (including the workplace's group and cost center) at which the operation is being completed in the selected shift is shown in addition to the order and article number.

Primary quantities category**Target quantity**

The operation's target quantity in each of the quantity units (primary quantity unit, secondary quantity unit, tertiary quantity unit, base quantity unit).

This column is not added up. Since totals formation is not correct if one and the same operation is produced during several shifts.

Yield

The yield posted for this operation in relationship to the selected shift.

Scrap

The scrap posted for this operation in relationship to the selected shift.

Rework

The rework quantity posted for this operation in relationship to the selected shift.

Open quantity

The open quantity posted for this operation in relationship to the selected shift.

Quantity unit

The relevant unit of quantity.

Duration category**Target duration**

The target duration relating to the operation is edited as follows:

$((\text{Operation's target cycle [per 1000]}) / 1000 / \text{the operations partitioning} * \text{operation's target quantity in primary quantity unit}) + \text{operation's setup time}$

This column is not added up. Since totals formation is not correct if one and the same operation is produced during several shifts.

Production

The production time entered for this person at the operation in relationship to the selected shift.

Downtime

The downtime entered for this person at the operation in relationship to the selected shift.

Sum

Sum of all production times and downtimes (sum of columns Production + Downtime)

RPA category**RPA**

Detailed presentation of the actual times entered at the resource performance accounts level.

Please note:**Displaying the actual quantities and the actual durations (RPA)**

For workplaces that are either not assigned to any terminal or for those that are assigned to a terminal configured as a BDE (shop floor data collection) terminal, there is no shift automation. This means that there are no automatic order or person-related postings at the end of shifts. Because this means that there is also no exact shift relationship to the entered quantities and durations, in this case a proportionate assignment is made in the shift log. This assignment is made using the workplace's shift calendar as the basis.

Example:

In this case we have a shift model set for shift 1: 6.00 am to 2.00 pm and for shift 2: 2.00 pm to 10.00 pm. This shift model is assigned to a workplace that is in accordance with the criteria listed above. Furthermore, we also have an OP log-in at 1.00 pm and an OP logoff at 4.00 pm. For the OP logoff, 90 is uploaded as the yield.

In this case, the shift log for the operation in shift 1 will calculate an order duration of 60 minutes and a yield of 30. For shift 2, an order duration of 120 minutes is calculated and a yield of 60. The RPA-related durations are also calculated based on the shift model that the workplace is based on.

Display of the personnel time in the personnel shift log

In the personnel shift log, the identifier "Post production to main utilization during break" from the HYDRA basic settings is NOT taken into account. This means that the labor duration posted to main utilization (RPA 11) during breaks is removed from the postings the calculation is based on (record type "B").

For example: the calculation is based on a shift model from 6.00 am - 2.00 pm with a break between 12.00 noon and 1.00 pm. The status Production is in effect from 6.00 am to 12.30 pm and from 1.00 pm to 2.00 pm.

7.30 hours will be posted as main utilization time for a person logged on from 6.00 am - 2.00 pm (assumption: no multiple machine operation) - if the identifier "Post production to main utilization during break" is set. When the personnel shift log is called up, this time is compared to the shift calendar so that a main utilization time of 7.00 hours is calculated for the shift model provided above.

Durations acc. to person detail application

Shown in the "Durations acc. to person" detail application are the durations posted to each person. Considered here are the operations that were selected in the personnel shift log detail application.

The bar chart shows the person (personnel number) for the selected operations on the Y axis and the absolute values (durations) on the X axis. The bar colors are based on each quantity account (production/ RPA 11: green; downtimes/ RPA 1-11: red). Bars are sorted in descending order by production duration.

You can define for which durations you would like to show bars from a multi-combo box:

- Production
- Downtimes

The bars are shown "stacked" so that as a result the total quantity can be defined differently for each user specifically.

By activating the check box "Show labels", the values are shown on the bars. What needs to be considered is that these labels are displayed for each selected duration.

Quantities acc. to person detail application

Shown in the "Quantities acc. to person" detail application are the cumulated quantities (primary quantity unit) posted to each person. Considered here are the operations that were selected in the personnel shift log detail application.

The bar chart shows the person for the selected operations on the Y axis and the posted quantities on the X axis. The bar colors are based on each quantity account (yield: green; scrap: red, rework: blue, open quantity: gray). Bars are sorted in descending order by yield.

You can define for which quantity accounts (primary quantity unit) you would like to show bars from a multi-combo box:

- Yield
- Scrap
- Rework
- Open quantity

The bars are shown "stacked" so that as a result the total quantity can be defined differently for each user specifically.

By activating the check box "Show labels", the values are shown on the bars. What needs to be considered is that these labels are displayed for each selected quantity account.

Toolbar

In general, the parameters for calling the function or target application are taken over from the table. For this reason, an entry should always be selected before calling an application.
