1 HYDRA 7 Energy management interfacing

Overview

Purpose

HYDRA 7 This provides the required BDE/MDE data from the HYDRA 7 system for selected analysis tools in HYDRA 8 EMG.

Implementation considerations

You use energy management interfacing if you:

- intend to operate a HYDRA 8 EMG installation parallel to an existing HYDRA 7 (MW 2.1) solution with BDE/MDE.
- wish to use the relevant operation data and recorded MDE data from the HYDRA 7 system for evaluation purposes and parameter calculation within HYDRA 8 EMG in the consumption correlation and efficiency report (energy-related).

HYDRA 7 and HYDRA 8 use the same database system (ORACLE or Microsoft SQL Server). The database system versions may be different.

Currently supported ORACLE versions:

- Oracle 9.2
- Oracle 10g
- Oracle 11g Release 2

Currently supported MS SQL server versions:

- Microsoft SQL Server 2000
- Microsoft SQL Server 2008
- Microsoft SQL Server 2008 R2
- Microsoft SQL Server 2012

Please note:

It is not possible to establish a connection from a Microsoft SQL Server 2012 to a Microsoft SQL Server 2000.

Integration

Energy management interfacing provides the ADE and MDE logs for the HYDRA 8 energy management evaluations

- Consumption correlation
- Efficiency report (energy-related)

Features

The BDE/MDE data recorded in HYDRA 7 that are relevant for evaluation are made available in the HYDRA 8 MOC analysis applications Consumption correlation and Efficiency report (energy-related).

The machine master data are not adopted from the HYDRA 7 system. These must be entered manually in the HYDRA 8 EMG system.

The application "Consumption correlation" provides the order and operation data of the online area. Order and operation data contained in the archive tables (long-term data) are not available for evaluation. If access to long-term data is necessary, it is possible to switch to "Long-term" by means of a specific HYDRA configuration. Evaluation of the data of the online area will then no longer be possible.
