1 Interface qs-STAT for FEP

Purpose

This component enables you to export inspection data in the qs-STAT data export as DFQ file format, using comprehensive filter criteria.

Implementation notes

You use this component if special statistical evaluations are required and the third-party software "qs-STAT®" by Q-DAS has been installed.

Integration

The basis for this component is the quality data recorded in HYDRA with regard to the variable and attributive inspection step characteristics.

Features

The following functions are available:

- Filtering of the existing data pool of in-production and goods issue inspections
- Automatic processing of filtered data for further processing in qs-STAT®
- Automatic start of qs-STAT with filtered and processed data

2 Qs-STAT® data export

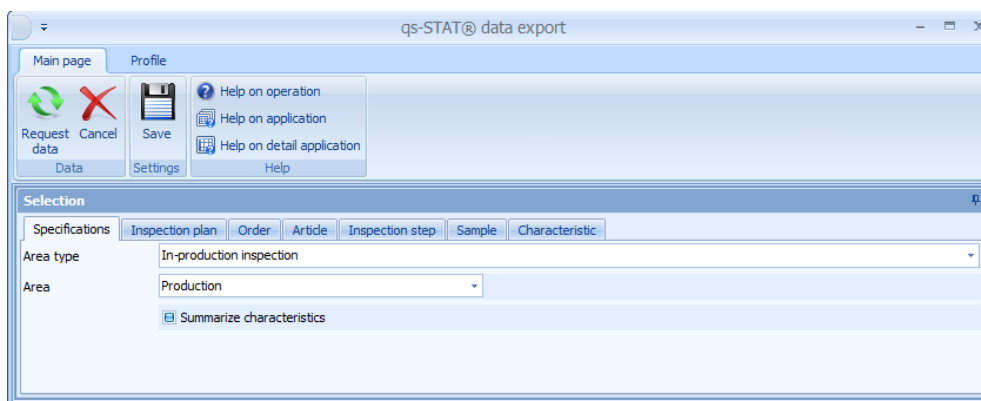

Overview

This document describes the "qs-STAT® Data Export" application in the Manufacturing Operation Center (MOC).

Starting the function

Menu	Quality management → QM evaluation → qs-STAT® Data Export
Transaction code	qsstat
Function authorization	qsstat.export

Default application layout

Usage

This application enables characteristics (sample data) to be transferred to the program package qs-STAT® for further analysis. The selection can be limited using numerous filters based on the orders, the underlying inspection plans, characteristics and samples.

Selection criteria

For requesting the data, the fields

- Area type
- Area

must be filled as a minimum requirement. If data are requested without these two filter criteria being specified, an error message will occur.

If the checkbox "Summarize characteristics" is checked, all inspection results matching the filter criteria are exported to qs-STAT® as "one characteristic". This is also the case if the inspection results were recorded for multiple different characteristics in HYDRA.

A detailed description of the other filter criteria is not included here, as they are self-explanatory.

Selection of data volume

In general, a characteristic in this evaluation can be identified via the operation sequence number (OP sequ. no.) or the characteristic number.

If you filter by the OP sequence, a characteristic can be identified unambiguously within an inspection plan. This can make sense if, for example, several characteristics with identical characteristic number appear within an inspection plan.

If filtered by the characteristic number, reports can also be started if the number and/or sequence of characteristics has changed across several inspection plans

Automatic start of qs-STAT®

The user has to ensure that the file extension is linked with the correct program to start the qs-STAT® program automatically after an export. If assistance is required, you must contact Q-DAS (manufacturer of qs-STAT®).
