1 Overview: personnel requirements depending on orders

Purpose

Use this function package to define for each operation the personnel requirements for setting up and producing orders. If, for example, personnel requirements depend on the item to be manufactured, this function package enables you to configure the requirements for each operation.

Implementation notes

Use the function package if:

- personnel requirements for a workplace are not constant, but depend on the planned operation.

Integration

In order to use this function package, you require the function package *Management Functions for Personnel Scheduling*.

Features

- Personnel requirements defined by the machine/operator relation of operations
 - The application identifies personnel requirements based on the machine/operator relation defined for the operation and the assigned qualification.
- Personnel requirements of production resources and tools
 - The resource list defined for the operation can also specify the personnel requirements.
- Transfer of order run times
 - The application transfers order run times from the HYDRA detailed planning tools to define personnel requirements (graphic planning / graphic order sequencing in HYDRA-BDE; separate license required).

2 Definition of Workforce Requirements

2.1 Workforce Requirements of the Machine/Operator Relation

You can define workforce requirements for setup and production of [operations](#) using the machine/operator relations for setup and production. You can define these requirements in the fields "M/O relation production" and "M/O relation setup" in the "processing" tab. An entered value is only interpreted as staff requirement if the required qualification is assigned in the "qualification" field.

If you use the machine/operator relations to define workforce requirements, you can only specify one qualification each for setup and production. If several different qualifications are required for setup or for processing the operation, you have to define the workforce requirements via the production resources and tools list.

The two qualification fields are only visible if the license PEP-AEP (order-dependent identification of workforce requirements) has been purchased.

2.2 Personnel requirements of production resources and tools

You can use [production resources and tools](#) D:\live\svn\en\Functions\MOC\MOC_EditProdResources.pdf to define workforce requirements. The resource type *PRU* defines the requirements for the setup of an operation. The resource type *PER* specifies the requirements for the production of an operation. The field "resource" includes the number of the required [qualification](#) and the field "required quantity" includes the personnel requirements. You do not have to enter a unit for the required quantity.

The production resources and tools enable you to configure several requirements with different qualifications for setup and production.

3 Priorities when processing workforce requirements

There are several options to define workforce requirements. The following priorities apply:

Priority	Workforce requirements
1	Workforce requirements of production resources and tools
2	Workforce requirements of the machine/operator relation of operations
3	Workforce requirements of workplaces...\functions\MOC\MOC_PersonnelRequirementOfWorkplaces.pdf

This means, personnel requirements defined for a workplace will only be processed, provided that the production resources and tools and the machine/operator relations do not include staff requirements for the operation.
