1 Order-Dependent Workforce Requirements - Overview

Purpose

This function package contains functions to define the personnel requirement for order setup and completion per operation. If, for example, the personnel requirement is dependent on the article to be manufactured, this function package allows the setup of the requirement per operation.

Implementation Considerations

Use this function package if:

- the personnel requirement at a workplace is not constant, but depending on the planned operation.

Integration

Use of this function package requires function package *Personnel Scheduling Administration Functions* (PEP-VWF).

Features

- Personnel requirement in the machine / operator relation of the operations
 - Personnel requirement determination based on the co-worker / operator relation of the operation and the respective qualification
- Personnel requirement for production resources and tools
 - Alternative definition of personnel requirement through the operation's resource list
- Order duration transfer
 - Order duration transfer from HYDRA detailed scheduling tools (graphic planning / graphic order sequencing in HYDRA-BDE)

2 Workforce Requirements of Machine/Operator Relation

Summary

Workforce requirements for setup and production can be defined for [operations](#) using the machine/operator relations for setup and production in the fields M/O relation production and M/O relation setup of the “processing” tab. An entered value is only considered staff requirements if the required qualification is assigned in the “qualification” field.

Using the machine/operator relations for defining workforce requirements only allows the definition of one qualification each for setup and for production. If several different qualifications are required for setup or for processing the operation, workforce requirements have to be defined using the list of production resources and tools.

The two qualification fields are only visible if the license PZE-AEP (order-dependent workforce requirements) has been purchased.

3 Workforce Requirements of Production Resources and Tools

Summary

Workforce requirements can be defined using [production resources and tools](#). The resource type “PRU” defines the requirements for the setup of an operation. The resource type “PER” defines the requirements for the production of an operation.

The production resources and tools enable configuration of several requirements with different qualifications for setup and production.

4 Priorities when Processing Workforce Requirements

Summary

There are several options to define workforce requirements. The following priorities apply:

Priority	Workforce requirements
1	Workforce requirements of production resources and tools
2	Workforce requirements of the machine/operator relation of operations
3	Workforce requirements of workplaces

This means, for example, workforce requirements defined for a workplace will only be processed if no workforce requirements are defined in the production resources and tools and the machine/operator relation for this operation.
