1 Additional Selection and Visualization - Overview

Purpose

This function package contains functions to select employees and workplaces using additional selection criteria and to display the qualifications in color coding.

Implementation Considerations

Use this function package to:

- use HYDRA personnel scheduling with the requirement to subdivide the employees and workplaces into smaller groups that can be scheduled more easily;
- display the qualifications for the workplace assignment in color coding.

Integration

Use of this function package requires function package *Personnel Scheduling Administration Functions* (PEP-VWF).

Features

- Planning profile
 - Definition of planning profiles to subdivide the allocated employees and workplaces in groups that can be scheduled more easily
- Additional filter function
 - Additional filter functions to select the persons using various HR master data fields (e.g. Department, Employee subgroup, Activity, fields containing additional information)
- Color representation
 - Displaying the Personnel requirement through colored bars to allow the scheduler to easily identify the required qualification and the available resources with their respective qualifications

2 Planning Profiles

Summary

Menu	Master Data → Production Control → Planning Profiles
Transaction code	plprof
Function authorization	plprof

Usage

You use this function to create or modify planning profiles in the system.

Integration

By using planning profiles, you can narrow down what is displayed in the different planning functions:

- HYDRA shop floor scheduling
(only selected on a group level)
- Graphic order sequencing
(only selected on a group level)
- Personnel assignment (PEP)
(Here, you can select additional options, such as cost center, area, ...)

Prerequisite

You have structured the workplaces to be planned based on capacity groups and set them up in the system.

Selection criteria

The application provides the following selection criteria:

User

User name for whom the planning profiles that were configured beforehand are to be displayed.
You can also run a search using wildcards.

Planning profile

Name of the planning profile to be searched. You can also run a search using wildcards.

Field descriptions

User

User for whom the subsequent capacity group is to be assigned or is assigned in the planning profile.

Profile

Name of the planning profile.

Selection

Where planning profiles for the graphic planning board or the graphic order sequencing are concerned, here you must definitely set "Machine group/ MGRP" as a fixed variable.

When using the planning profiles for personnel scheduling, other values are also allowed.

Value

You enter the capacity group here.

Sequence

This field specifies the order of the groups in the [graphic planning board](#).

We strongly advise to input data in this field, because the order of the groups might otherwise be arbitrary. Ideally, you should use intervals of 10 here.

Within a group, workplaces may be sorted by using the "position" field of the [group assignment](#).

The following options are only relevant for the [graphic planning board](#):

Visible in shop floor planning

By modifying this field, when selecting the planning profile, you determine whether the current group is displayed or not.

Show workplaces without responsibility area authorization

Shows the workplaces of the selected group in shop floor scheduling for which the user does not have the responsibility area authorization.

Allow predecessor/ successor OP to be moved

When resolving conflicts that occurred during manual planning interactions, this option moves an operation for which the user does not have the responsibility area authorization. This operation cannot be moved by the planner manually. A move can only be effected by resolving conflicts.

3 Additional Filter Functions

Summary

This function allows to overwrite the fields “company”, “area” and “cost centers” by other HR master fields in the [workplace assignment](#) application:

4 Colored Illustration

Summary

When configuring [qualifications](#), this function allows to assign a color to each qualification. The application [workplace assignment](#) shows the requirements and the staff's highest qualification in this color.
