1 Enhanced Compensation Rules

Purpose

Application Service to define extended compensation rules and posting rules

Implementation Considerations

Use this function package to:

- define leave entitlement depending on an employee's age or staff membership time;
- compensate overtime on a weekly basis (or on the basis of a different period);
- control wage types depending on employee attendance or other wage types.

Integration

This function package can only be used if HYDRA is used for time management (function package *Time and Labor Data Evaluation*).

Features

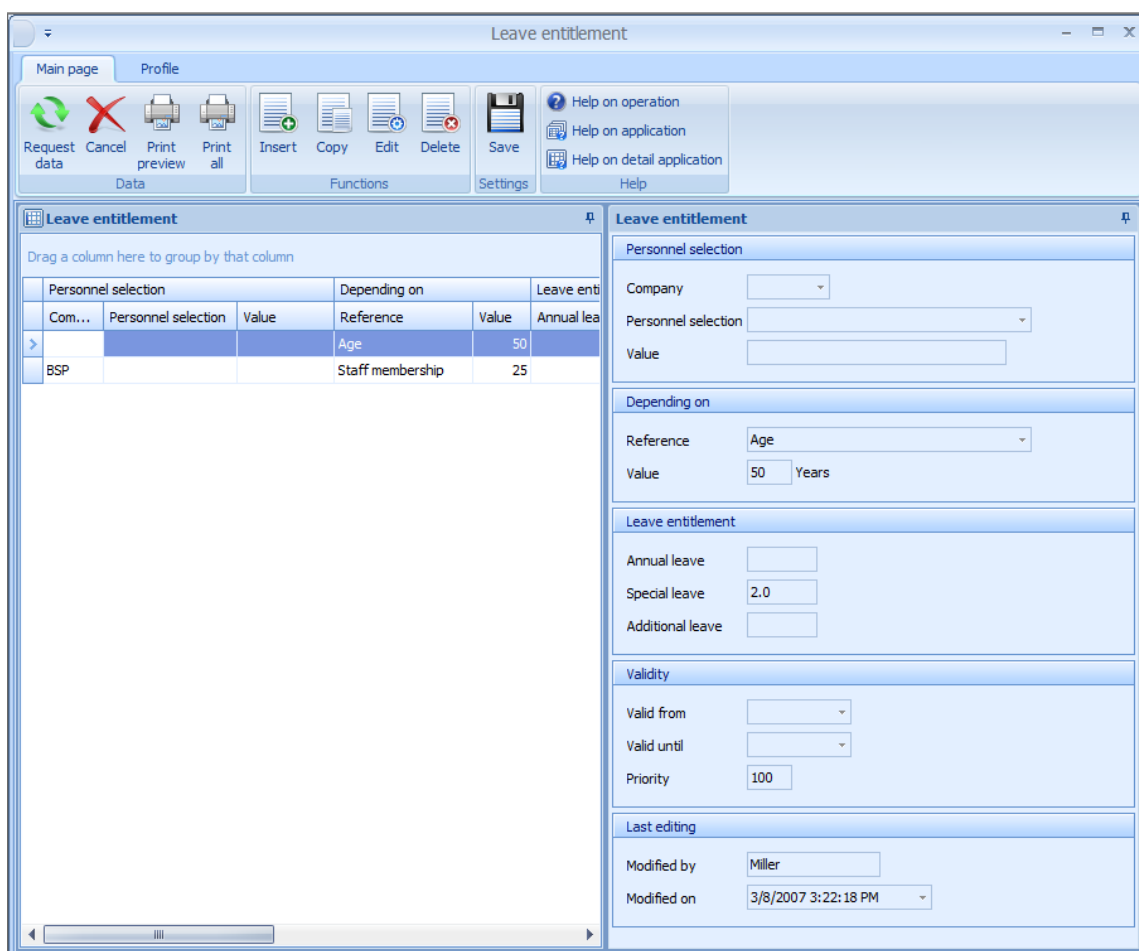

- Leave entitlement
 - Recording annual leave entitlement optionally depending on employee age or staff membership time
- Payment depending on shift type
 - Defining different payment rules depending on shift worked
- Overtime compensation on a weekly basis
 - Optional compensation of overtime on a weekly basis or based on another period
- Additional allowances rules
 - Posting wage types for additional allowances (e.g. travel cost) depending on the initial wage type duration
- Wage types relations
 - Rules to report, summarize or delete wage types depending on the initial wage type duration

2 Leave Entitlement

Summary

Menu	Master Data --> Labor Time --> Leave Entitlement
Transaction Code	plen
Function authorization	plen

The leave entitlement may be defined for different groups of employees, subject to their staff membership or age. But the leave entitlement may also be defined for such groups without any dependencies.

Field Descriptions

Company

Restricts the leave entitlement to a particular company. If this field remains without an entry, the leave entitlement applies for all companies.

Personnel selection, value

The personnel selection field specifies whether the leave entitlement is to be configured for a person or a group of employees. The available employee groups include area, cost center, department, personnel number, employee subgroup, activity and salaried/non-salaried employee. The value for the personnel selection field is defined within the "value" field. The leave entitlement applies to all employees if no selection is made.

Reference, value

Leave entitlement may either be planned subject to the age or staff membership.

Leave entitlement

The sum of the fields *Annual leave*, *Special leave* and *Additional leave* will be credited to the employee's leave account (4th account when defining accounts) on 1st January.

Any changes made to the entitlement to annual leave, special leave or additional leave are only reflected in the leave account when the labor time calculation for the 1st January is started.

Valid from, to

These two fields restrict the validity of the leave entitlement to a specific period of time. If only one of these two fields is filled, then the entry is valid from or to that date.

Priority

If leave entitlement is defined for different employee groups and more than one of these configurations applies to a single employee, the priority determines which entry has precedence.

The corresponding entitlement is taken from the HR master, if one of the fields for entitlement to annual leave, additional leave or special leave is left empty. This allows, for example, for the annual leave entitlement to be specified by configuration and the additional leave entitlement for severe disability to be edited using the HR master.

3 Payment Depending on Shift Type

Summary

Menu	Human Resources Management → Models → Payment Depending on Shift Type
Transaction code	past
Function authorization	past

The “payment depending on shift type” option allows for payment day types to be defined subject to the shift type. Consequently, it is possible to use different payment models for early shift and night shift.

If the day type entered in the “from payment” column is planned for a person and this person worked in the shift type that is entered in the “for shift type” column the day type entered in the “to payment” column will be used for payment:

The screenshot displays the 'Payment depending on shift type' application window. The main area contains a table with the following data:

From payment		For shift type	To payment		Last editing	
Day type	Designation	Shift type	Day type	Designation	Modified by	Modified on
200	3-Shift Mo-Fr	S	205	3-Shift Afternoon	12345	3/22/2000 9:13:23 AM

The right sidebar provides a detailed view of the selected row, showing the 'From payment' (Day type: 200, Designation: 3-Shift Mo-Fr), 'For shift type' (Shift type: S), 'To payment' (Day type: 205, Designation: 3-Shift Afternoon), and 'Last editing' (Modified by: 12345, Modified on: 3/22/2000 9:13:23 AM).

Utilization

This function is used if payment for the single shifts is different and the shift rhythm cannot be planned properly due to frequent changes.

The shift type payment is also processed for absences. This allows for absences to be allocated subject to the shift type.

Field Descriptions

“From payment” day type

Number of the payment day type for which the configuration applies.

For shift type

If this shift type occurs the first payment day type will be converted to another one.

“To payment” day type

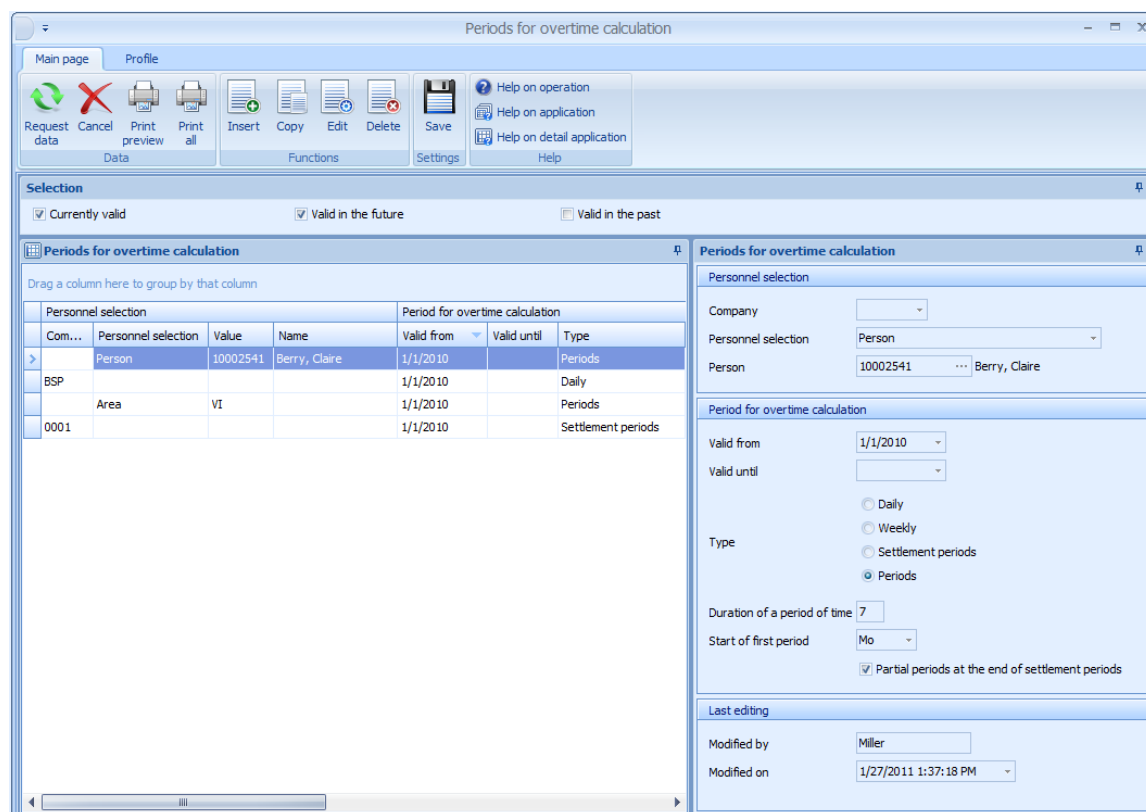

Day type to which the first day type is to be converted.

4 Periods for Overtime Calculation

Summary

Menu	Master Data → Labor Time → Periods for Overtime Calculation
Transaction code	ptop
Function authorization	ptop

The periods for overtime calculation are defined in this dialog.

Utilization

Overtimes may be compensated on the level of days, weeks or settlement periods. The selected period affects the process of evaluations:

- Overtime compensation on a daily basis has the advantage that wage types are evaluated quickly and posted clearly. Provided that no urgent reasons in favor of longer periods are available, we recommend to configured the **“daily”** period.

- Overtime compensation on a weekly basis is used if weekly remuneration rules are available and results in overtime and reduced working hours to be balanced during the week and the result of overtime or reduced working time to be compensated at the end of the week using the overtime type that is entered in the HR master. The entire week is recalculated if a clocking record changes as overtime or reduced working hours might have changed as well. For this reason the daily evaluation for weekly overtime periods takes a little bit longer.

Examples for weekly remuneration rules:

The first five hours of “overtime” during the week are paid with an overtime bonus of 25%. A bonus of 50% is paid once five hours of overtime have been exceeded during the week.

- When it comes to the compensation on the basis of [settlement periods](#) the entire settlement period is recalculated. This kind of settlement is rarely used. Remuneration rules on the basis of settlement periods are mostly represented by [account limits](#).

Periods for overtime calculation that apply to periods of the past cannot be deleted. Changing of periods for overtime calculation applying to the past might lead to errors in the compensation. The validity end date of the current configuration has to be set and a new entry needs to be created to avoid this.

Field Descriptions

Valid, until

Validity period to configure periods for over time calculation. The configuration applies without restrictions if both fields remain empty. The validity end date normally remains empty and is only set if the periods for overtime calculation change as of a specific date.

Type

Daily

Daily periods for overtime calculation are configure using this option.

Weekly

This option configures weekly periods for overtime calculation. Partial periods are generated at the end of the settlement period if this option is set. The results of the first partial week are taken into account, when the second partial week is evaluated. But wage types that have already been posted are no longer changed.

Settlement periods

If this field is selected periods for overtime calculation are processed just as it is the case for [settlement periods](#).

Periods

If this field is selected configurations for fixed periods can be created.

Duration of a period

Only enabled for the “periods” type:

Duration of a period in days. “7” is entered here for weekly compensations.

Start of first period

Only enabled for the “periods” type:

Defines on which day the first period is supposed to start for the overtime calculation. This field may include the following entries:

<Leer>: The first period starts on the entered validity start date.

Mon/Tue/Wed/Thu/Fri/Sat/Sun: Weekday in the first week after the validity start date when the first period starts.

Partial periods at the end of settlement periods

Only enabled for the “periods” type:

If this option is checked partial periods are generated at the end of the settlement period. The results of the first partial week are taken into account, when the second partial week is evaluated. But wage types that have already been posted are not changed anymore. This configuration is required if the settlement is to be made before the second partial week is over.

If this option is disabled the month-end closing may only be performed once the complete week is over that includes the two different settlement periods, as evaluated days of the new settlement period may affect the data of the previous settlement period.

5 Attendance Bonus

Summary

Menu	Master Data → Labor Time → Attendance Bonus
Transaction code	atbo
Function authorization	atbo

The “attendance bonus” module allows for the assignment of an additional allowance (e.g. attendance bonus) for employees who work on special days. It is also possible to define fixed special payments, such as travel expenses, allowance for food, or similar. Posting is triggered using a wage type. When this wage type (initial wage type) occurs, a time bonus is posted onto the “presence wage type”. The initial wage type may be deleted, once everything has been settled. The presence wage type is posted subject to the duration posted on the initial wage type.

The screenshot shows the 'Add. allowances rule' configuration window in SAP. The main table lists the initial and presence wage types. The right panel provides detailed configuration for each wage type, including duration, alignment, and validity.

Initial wage type						Presence wage type		
Wage t...	Designation	Refer...	Duration	Percentage	Delete	Wage t...	Designation	Duration
200	Extra work	Duration	1:30			528	Extr.wrk. Prem.	1:00
100	Basic wage	Duration	0:00					

Initial wage type configuration:

- Wage type: 200 (Extra work)
- Duration: 1:30
- Reference: ☒ Duration, ☐ Target time, ☐ Normal time
- Alignment: ☒ To, ☐ Before, ☐ Midnight
- Point in time: ☐ Beginning of initial wage type, ☐ End of initial wage type
- Authorization required: ☐

Presence wage type configuration:

- Wage type: 528 (Extr.wrk. Prem.)
- Duration: 1:00
- Alignment: ☐ Before, ☒ To, ☐ Midnight
- Point in time: ☐ Beginning of initial wage type, ☐ End of initial wage type
- Authorization required: ☐

Validity:

- Company: [dropdown]
- Valid from: [dropdown]
- Valid until: [dropdown]

Field Descriptions

Initial wage type

The additional allowance is granted when this wage type is posted. Several rules may be defined for an initial wage type. The rule that has the greatest possible “as of duration” is processed for the initial wage type.

Reference

Attendance bonuses can be defined subject to the duration or a percentage rate of the target or normal time.

Duration/percentage

Amount of time that has at least to be posted onto the initial wage type by the payroll day in order for the posting to the presence wage type to be made.

The required amount of time may be defined as absolute duration or subject to a percentage rate of the target or normal time.

Delete

All postings of the initial wage type are deleted and are no longer available, once the rule has been executed.

Presence wage type

Wage type onto which the time bonus from the “duration” field is posted.

Duration

Time posted onto the presence wage type. Values are entered in the hours:minutes format.

Alignment

Before:

The attendance bonus is posted so that it ends at the selected point in time.

After:

The attendance bonus starts at the selected point in time.

Point in time

Point in time when posting to the presence wage type is to take place:

Midnight:

Posting takes place at 0:00 midnights.

Beginning:

Posting is set to the beginning when the initial wage type was posted the first time.

End:

Posting is set to the end when the initial wage type was posted the last time.

Authorization required

Posting to the presence wage type is subject to authorization.

Company

The attendance bonus is restricted to a specific company. If no company is entered the attendance bonus applies to all companies.

Valid from, until

Validity period for the attendance bonus. The attendance bonus applies without restriction if both fields are empty.

6 Wage Type Relations

Summary

Menu	Master data→ Labor time→ Wage types relations
Transaction code	wtia
Function authorization	wtia

This module can be used to configure relations between wage types.

Usage

When hiding, only the "stronger" wage type will be maintained if there are two wage types in the same time. Example:

When two wage types are comprised to a third one, the period during which the corresponding wage type postings will overlap, will be posted with the third wage type. Example:

A *transfer posting* of a wage type is used to repost the posting of one wage type to another one. This is useful in connection with the selection of the area of validity of the rules for "company" and "selection". Reposts can effect for example that different wage types are posted for salaried employees than for non-salaried employees. This is possible using reposts of corresponding validity criteria without having to change two different payment day types.

The *deletion* of a wage type is used to delete remaining auxiliary wage types again so that they will no longer be shown in the display of the user interface.

Field descriptions – Wage types relations tab

Processing

This is used to select whether a wage type is summarized, hidden, reposted, deleted or copied.

Initial wage type

In hiding, the "strong" wage type will be shown here; for a summary this would be the first source wage type, for of a deletion the wage type to be deleted, for of a repost the wage type to be reposted and for of a copy the wage type to be copied.

Initial wage type 2

In hiding, the "weak" wage type will be shown here and for of a summary the second initial wage type.

Target wage type

For of a summary, repost or copy the target wage type will be shown here. No entry will be made into this field when hiding and deleting.

Sequence

A number can be assigned to each wage type relation. The rules will be processed in the order of the numbers and also be shown as such on the screen.

Duration from, to

These fields allow to restrict the wage type relation to an interval of that daily duration that was posted to the source wage type. The wage type relation is used for the total duration - irrespective of the *Duration from*.

Process from

Duration, from which on the wage type relation will be active. The wage type relation will not be applied to that posted time that comes before that duration. This field can be used for example to effect that overtime from the 2nd hour on will be posted to a higher bonus.

Comment

It is possible to enter a comment for each rule.

Date from, to

These fields can be used to restrict the validity period of a rule. The fields can be left empty if no restriction regarding the start or end of validity is to be defined.

Company

This field can be used to restrict the validity of a rule to a specific company. If this field is left empty, the rule will apply for all companies.

Selection

This field is used to additionally restrict the validity area of a rule. A selection can be made according to the following fields of the HR master data: area, cost center, department, personnel number, employee subgroup, activity and employee relationship. If a selection was made, another field will be visible into which the corresponding value will be entered.

Field description - Options tab**Period**

If the duration of the overtime periods exceeds one day, this can be used to define whether the wage type relation will be executed individually per day or for the total overtime period. This setting will also affect the determination of the duration in order to control the condition *Duration from, to* and the field *Process*.

Point in time

This option can be used to define whether the wage type relation is to be processed at the daily evaluation, prior to or after the account compensation, or at the monthly evaluation (after the limitation of the accounts).
