1 MES Weaver - Additional MES Instances

Purpose

A HYDRA instance makes it possible for several independent HYDRA systems to be operated on the same server.

Application scenarios for a separate HYDRA instance are:

- Production system (instance 1) and test system (instance 2)
- Systems divided up into separate instances based on special criteria, such as
 - one instance per company
 - one instance per plant
 - one instance per time zone

Implementation considerations

It is possible to upgrade by adding an additional instance at any time, whereas the following requirements must be considered:

- The server must have sufficient resources (see HYDRA hardware/ software recommendations)
- The server is not available for a certain amount of time during installation
- MPDV implementation performs the expansion by adding an additional HYDRA instance

Please refer to the hardware/ software recommendations mentioned above for more information

Integration

-

Features

- Separate system settings for each instance or system
- Multisystem-capable availability of all HYDRA modules
- Data storage in logically separate databases
- Data back-up capability for each system or instance
- Separate time zone for each instance
