1 Upgraded Access Control - Overview

Purpose

This function package offers advanced options for the access control management.

Implementation notes

You use the function package if:

- you want to create replacement badges for employees who have forgotten their badge;
- you want to open access points automatically at defined times;
- you want to secure access points via an additional request of a pin code.

Integration

This function package can only be used if the HYDRA access control module is in use (function package *access control management functions*).

Features

- Replacement badges
 - You can define replacement badges for employees who have forgotten their badge.
- Opening doors permanently
 - You can open access points permanently for a specific period of time depending on the weekday and public holidays.
- Pin codes
 - You can request an additional pin code at security relevant access points at predefined times (e.g. at night, at the weekend, on public holidays).

2 Replacement badges

Replacement badges can be assigned to employees who have forgotten their [Badge](#).

If you create or modify a replacement badge, the system directly takes over the [Access profile assignments](#) of the corresponding staff badge. This ensures that the replacement badge has the same authorizations as the staff badge.

[Clocking authorizations](#) for time & attendance are assigned to the person via the personnel number. They automatically apply for the replacement badge. Replacement badges can also be used for the shop floor data collection.

3 Permanent opening of doors

You control the permanent opening of a door via the [Opening hours](#) of an [Access group](#). An access point is permanently opened if the two options *Badge required* and *Pin code required* are disabled for an [Access period](#).

4 Pin codes

If an employee loses his/her badge, unauthorized persons can misuse this badge as long as this loss has not been notified and the badge has not been blocked in the system. You can avoid this misuse if relevant access points require the badge and the employee's pin code.

An employee's pin code is defined in the field *Pin code* in the submenu [Badge](#). Employees without pin code cannot enter an access point if the pin code request is enabled at this access point.

You define the times and weekdays or public holidays which require the pin code in addition to the badge in the menu point [Opening hours](#) of the [Access group](#). Set the option *Pin code required* in the [Access periods](#) to enable this processing.

Access attempts that were rejected because of a wrong pin code are shown in the [Access log](#) with the reason "wrong pin code".
